Framework Configuration Options Reference

This document describes the configuration options for the Genesys 8.5 Framework components, which you must configure in the Configuration Layer. This document is designed to be used along with the *Framework Deployment Guide*.

Configuration options, enabled when a component starts up, define that component's configuration. You set configuration option values in Genesys Administrator, where indicated by the "Setting Configuration Options" section for each component. Any mandatory options are listed in the "Mandatory Options" section for each component. For applications that are configured by configuration files, namely Configuration Server and Local Control Agent, set options in the respective configuration file for the application.

The options in the current document are divided by sections, as they are in a component configuration. Section names are set by default; changing them is not recommended.
