Enable Inline Grammar Access by URL

5/6/2025

Enable Inline Grammar Access by URL

Follow these steps to enable inline grammar access by URL:

Windows IIs Environment

1. Verify that IIS is installed and started, and that MCP is installed.

2. Create and add the directory `inlinetmp` under `C:\Program Files\Common Files\GCTI\www\gvp\mcp\<MCP_application>\grammar\`.

Steps 3 and 4 are automatically performed by the MCP installation in a Windows 32-bit environment, but must be performed manually in a 64-bit environment:

3. Add the application `mcp` in IIS, which points to `C:\Program Files\Common Files\GCTI\www\gvp\mcp`.

4. Enable **Directory Browsing** and add the mime type `application/octet-stream` for the extension * to the application `mcp` in IIS.

Linux Environment

1. Verify that MCP is installed.

2. Create the virtual directory `/var/www/gvp/mcp/` by adding these lines of code to the file `/etc/http/conf/httpd.conf`:

```
Alias /mcp/ "/var/www/gvp/mcp/"
<Directory "/var/www/gvp/mcp/">
   Options Indexes MultiViews
   AllowOverride None
   Order allow,deny
   Allow from all
   ExpiresActive On
   ExpiresDefault "now plus 5 minutes"
</Directory>
```

3. Enable the `httpd` service
(run `chkconfig` and specify `level 345 httpd on`) ????????

4. Start the `httpd` service (run `start` in the directory `/etc/init.d/httpd`).

5. Add the directory `inlinetmp`, with grant read and access permission granted to all files and directories beneath `/var/www/gvp/mcp/<MCP_application>/grammar/`.
