iWD Deployment Guide

iWD Manager configuration options

iWD Manager configuration options

iWD Manager establishes a connection to Configuration Server at the moment of user login. The configuration needed to start the iWD Manager web application is read from property files. There are two levels of connection:

- System level connection—Connects to Configuration Server on behalf of the SYSTEM user at the moment of iWD Manager application startup before Tomcat starts, and reads the initial configuration required for web application.
- User level connection—Connects to Configuration Server on behalf of an actual user at the moment of login, and reads user-specific configuration.

iWD Manager configuration options are described [here](#).
