WebSphereMQ—JMS CP Application

This page provides an example to configuring a JMS Capture Point Application object when using WebSphere MQ.

This is a specific example of the more general configuration procedure.

Procedure: Configuring the JMS Capture Point application in Configuration Manager (WebSphere MQ example)

1. On the **Options** tab create a section called `settings`. In this section add the following options:
   - `capture-point-type=jms`
   - `inbound-queue-name=inbound` (the same as the corresponding Destination name)
   - `error-queue-name=jms-error`
   - `processed-queue-name=jms-processed`
   - `notification-queue-name=jms-notifications`
   - `xsl-inbound-transform-path=./iwd_scripts/iWD2IxnServerTransformer.groovy` (points to the default iWD Compatibility scripts)
   - `xsl-outbound-transform-path=./iwd_scripts/IxnServer2iWDTransformer.groovy`
   - `jms-connection-factory-lookup-name=my_ConnFactory` (the name of the connection factory that you created in WebSphere MQ)
   - `jms-initial-context-factory=com.sun.jndi.fscontext.RefFSContextFactory`
   - `jms-provider-url=file:///home/InteractionServer` (the path points to the folder where the **.bindings** file—in UNIX file format—is stored on the Interaction Server host)
2. On the **Connections** tab, add the Interaction Server which will use this JMS Message queue.

Next Steps

Configure the Interaction Server options to load JVM and the necessary libraries.
