Performance Management Advisors Deployment Guide

Verify Server Connections

12/15/2025

Verify Server Connections

Use the information on this page to help you check that all connections are working correctly for Frontline Advisor.

Verify the Frontline Advisor Server Connection

In your browser, type:

`http://<IP Address of FA Installation>: 8080/fa/com.informiam.fa.admin.gwt.AdminConsole/AdminConsole.html`

If the server is configured correctly and this is the first time you are logging in, the Login page displays.

Verify Apache Routing

Use the following procedure to check that Apache routing is working. If configured correctly, the Login page will display.

1. Use the Firefox browser to connect directly to the Apache server. Use a URL that contains the host or IP address (and, optionally, the port if not on port 80) of the Apache server.
2. Log in.
3. Check the site.

Change the Values at the Enterprise Node

The rules and thresholds are defined but disabled by default at the Enterprise level and cannot be removed from that level. Once the application starts up, these values can be changed and overridden at lower levels of the hierarchy for lower levels of control. See the [Frontline Advisor Administration User's Guide](#) for more information.
